3.18.1 Detailed Description

A test class - find and replace from this template for future class definitions.

One of the most common examples of concepts in quantitative finance is that of a statistical distribution. Random variables play a huge part in quantitative financial modelling. Derivatives, pricing, cash-flow forecasting and quantitative trading all make use of statistical methods in some fashion

Many of the chapters within this book have made use of random number generators in order to carry out pricing tasks.

In a nutshell, we are splitting the generation of (uniform integer) random numbers from draws of specific statistical distributions such that we can use the static classes elsewhere without bringing along the heavy random number generation functions.

Equally useful is the fact that we will be able to "swap out" different random number generators for our statistics classes for reliability, extensibility and efficiency
