3.8.1 Constructor & Destructor Documentation

3.8.1.1 MPI_BC()

`MPI_BC::MPI_BC ()`

[MPI_BC](#) class template filling.

Placeholder

The documentation for this class was generated from the following files:

- `/home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/MPI_broadcast.hpp`
- `/home/oohnohnoh1/Desktop/GIT/Research/Parallel/src/MPI_broadcast.cxx`

3.9 MPI_BC_Generic< T, Q, R > Class Template Reference

Public Member Functions

- **MPI_BC_Generic** (std::size_t n)

The documentation for this class was generated from the following file:

- `/home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/MPI_broadcast.hpp`

3.10 MPI_sorting_methods Class Reference

Public Member Functions

- void **Bubble_sort** (int a[], int n)

The documentation for this class was generated from the following file:

- `/home/oohnohnoh1/Desktop/GIT/Research/Parallel/src/MPI_reduce.cxx`

3.11 MPIInput Class Reference

Inheritance diagram for MPIInput:

Collaboration diagram for MPIInput:

Public Member Functions

- [MPIInput](#) (int, int)
MPIInput class - constructor.
- void **getData** (int *, int *, int *)
- void **bubbleSort** (int *, int)
- void [getDataPack](#) (float *, float *, int *)
- [~MPIInput](#) ()
Class destructor for MPI.
- void **test1** ()

3.11.1 Constructor & Destructor Documentation

3.11.1.1 MPIInput()

```
MPIInput::MPIInput (
    int mr,
    int pe )
```

[MPIInput](#) class - constructor.

int int constructor

Sets up the processor ranks and size for use in other functions

At the moment, we do not have a default constructor

3.11.1.2 ~MPIInput()

```
MPIInput::~~MPIInput ( )
```

Class destructor for MPI.

Destructor

MPI_Finalize() - What does it do?

3.11.2 Member Function Documentation

3.11.2.1 getDataPack()

```
void MPIInput::getDataPack (
    float * a_ptr,
    float * b_ptr,
    int * n_ptr )
```

< Placeholder

< Keeping track of where the data is

MPI_pack

MPI_pack allows one to explicitly store unctiguous data in contiguous memory locations, and MPI_unpack can be used to copy data from a contiguous buffer into noncontiguous memory locations.

< Now pack the data into buffer. Positon = 0 says start at beginning of buffer

MPI_unpack

MPI_unpack can be used to copy data from a contiguous buffer into noncontiguous memory locations. i.e. it is just the complete opposite of pack

The documentation for this class was generated from the following files:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/MPI_IO.hpp
- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/src/MPI_IO.cxx

3.12 OMP< T > Class Template Reference

Openmp explanation.

```
#include <openmp1.hpp>
```

Public Member Functions

- **OMP** (int)
- **OMP** (const **OMP** &OMPCopy)
- **OMP** & **operator=** (const **OMP** &ref)
- void **add** (T)
- void **addup** ()
- void **pi** ()

3.12.1 Detailed Description

```
template<class T>
class OMP< T >
```

Openmp explanation.

As we noted earlier, we'll usually specify the number of threads on the command line, so we'll modify parallel directive was with the num_threads clause. A clause in OpenMP is just some text that modifies a directive. The num_threads clause, it allows a programmer to specify the number of threads that should be executed in the following block:

```
pragma omp parallel num_threads (thread_count)
```

What actually happens when the program gets to the parallel directive? Prior to the parallel directive, the program is using a single thread, the process started when the program started execution.

```
< std::cout, std::endl
```

```
< std::size_t
```

```
< std::max
```

```
< std::allocator, std::uninitialized_fill, std::uninitialized_copy
```

The documentation for this class was generated from the following file:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/openmp1.hpp

3.13 Partstruct Struct Reference

Public Attributes

- int **class**
- double **d** [6]
- char **b** [7]

The documentation for this struct was generated from the following file:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/src/MPI_struct.cxx

3.14 PassFail Class Reference

Inheritance diagram for PassFail:

Collaboration diagram for PassFail:

Public Member Functions

- **PassFail** (std::istream &is)
- double **grade** () const
- bool **valid** () const
- bool **fulfill_reqs** () const
- **PassFail** (std::istream &is)
- double **grade** () const
- bool **valid** () const
- bool **fulfill_reqs** () const

Additional Inherited Members

The documentation for this class was generated from the following files:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/Core.h
- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/openmp_dynamicbindingandinheritance.hpp

3.15 part1::Point Class Reference

```
#include <lib_mpi.hpp>
```

Public Member Functions

- **Point** (float _x, float _y, float _z)

Public Attributes

- float **x**
- float **y**
- float **z**

3.15.1 Detailed Description

This is a simple 3D point class

The documentation for this class was generated from the following file:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/lib_mpi.hpp

3.16 ProbDist Class Reference

```
#include <openmp_LA.hpp>
```

Public Member Functions

- double **norm_pdf** (const double &x)
- double **norm_cdf** (const double &x)
- double **d_j** (const int &, const double &, const double &, const double &, const double &, const double &)
- double **call_price** (const double &, const double &, const double &, const double &, const double &)
- double **put_price** (const double &, const double &, const double &, const double &, const double &)
- double **gaussian_box_muller** ()
- double **monte_carlo_call_price** (const int &, const double &, const double &, const double &, const double &, const double &)

3.16.1 Detailed Description

European Options with Monte Carlo

In this chapter, we will price a European Vanilla option via the correct analytical solution of the Black-Scholes equation, as well as via the Monte Carlo method. We won't be concentrating on an extremely efficient or optimised implementation at this stage.

-> Black Scholes Analytic pricing formula

The first stage in implementation is to briefly discuss the Black Scholes analytic solution for the price of a vanilla call or put option

The documentation for this class was generated from the following file:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/openmp_LA.hpp

3.17 Progression Class Reference

Inheritance diagram for Progression:

Public Member Functions

- **Progression** (long f=0)
- void **printProgression** (int n)

Protected Member Functions

- virtual long **firstValue** ()
- virtual long **nextValue** ()

Protected Attributes

- long **cur**

The documentation for this class was generated from the following file:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/openmp2.hpp

3.18 QTstyle_Test Class Reference

A test class - find and replace from this template for future class definitions.

```
#include <statistics.h>
```

3.18.1 Detailed Description

A test class - find and replace from this template for future class definitions.

One of the most common examples of concepts in quantitative finance is that of a statistical distribution. Random variables play a huge part in quantitative financial modelling. Derivatives, pricing, cash-flow forecasting and quantitative trading all make use of statistical methods in some fashion

Many of the chapters within this book have made use of random number generators in order to carry out pricing tasks.

In a nutshell, we are splitting the generation of (uniform integer) random numbers from draws of specific statistical distributions such that we can use the static classes elsewhere without bringing along the heavy random number generation functions.

Equally useful is the fact that we will be able to "swap out" different random number generators for our statistics classes for reliability, extensibility and efficiency

A more elaborate class definition

The documentation for this class was generated from the following file:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/statistics.h

3.19 RandomNumberGenerator Class Reference

Public Member Functions

- **RandomNumberGenerator** (unsigned long _num_draws, unsigned long _init_seed)
- virtual unsigned long **get_random_seed** () const
- virtual void **set_random_seed** (unsigned long _seed)
- virtual void **set_num_draws** (unsigned long _num_draws)
- virtual unsigned long **get_random_integer** ()=0

Protected Attributes

- unsigned long **init_seed**
- unsigned long **cur_seed**
- unsigned long **num_draws**

The documentation for this class was generated from the following file:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/random.hpp

3.20 Stack< T, CONT > Class Template Reference

Public Member Functions

- void **push** (T const &)
- void **pop** ()
- T **top** () const
- bool **empty** () const

The documentation for this class was generated from the following file:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/openmp_templates.hpp

3.21 StandardNormalDistribution Class Reference

Standard Normal Distribution Implementation.

```
#include <statistics.h>
```

Inheritance diagram for StandardNormalDistribution:

- virtual double **cdf** (const double &x) const =0
- virtual double **inv_cdf** (const double &quantile) const =0
- virtual double **mean** () const =0
- virtual double **var** () const =0
Variable 1.
- virtual double **stdev** () const =0
Variable 2.
- virtual void **random_draws** (const std::vector< double > &uniform_draws, std::vector< double > &dist_←
draws)=0
Variable 3.

3.22.1 Detailed Description

Statistical Distribution Class.

We've specified pure virtual methods for the probability density function (pdf), cumulative density function (cdf), inverse cdf (inv_cdf), as well as descriptive statistics functions such as as mean, var (variance) and stdev.

Finally, we have a method that takes in a vector of uniform random variables on the open interval (0,1), then fills a vector of identical length with draws from the distribution

3.22.2 Constructor & Destructor Documentation

3.22.2.1 StatisticalDistribution()

```
StatisticalDistribution::StatisticalDistribution ( )
```

A constructor.

Statistical Distribution.

Statistical Distribution constructor

A more elaborate class definition

3.22.2.2 ~StatisticalDistribution()

```
StatisticalDistribution::~~StatisticalDistribution ( ) [virtual]
```

Virtual destructor.

Constructor.

A more elaborate explanation here

The documentation for this class was generated from the following files:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/statistics.h
- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/src/statistics.cxx

3.23 Str Class Reference

A constructor with a character pointer input.

```
#include <openmp2.hpp>
```

Public Types

- typedef [Vec](#)< char >::size_type **size_type**

Public Member Functions

- [Str](#) ()
- **Str** (size_type n, char c)
- [Str](#) (const char *cp)
Last two custom constructors.
- template<class In >
[Str](#) (In b, In e)
create a [Str](#) from the range denoted by iterators b and e

3.23.1 Detailed Description

A constructor with a character pointer input.

Custom [Str](#) class

A numeric progression is a sequence of numbers, where the value of each number depends on one or more of the previous value.

Objects of built-in types generally behave like values: Whenever we copy an object of such a type, the original and copy have the same value but are otherwise independent.

For most of the built-in types, the language also defines a rich set of operators and provides automatic conversions between logically similar types. For example, if we add an int and a double, the compiler automatically converts the int into a double

When we define our own classes, we control the extent to which the resulting objects behave like values. By defining copying and assigning appropriately, the class author can arrange for objects of that class to act like values - that is, the class author can arrange for each object to have state that is independent of any other object.

Our [Vec](#) and [Student_info](#) classes are examples of types that act like values

We shall see that the class author can also control conversions and related operations on class objects, thereby providing classes whose objects behave even more similarly to objects of built-in types.

Defining a [Str](#) class that lets us create objects that behave approximately as we would like.

3.23.2 Constructor & Destructor Documentation

3.23.2.1 [Str\(\)](#) [1/3]

```
Str::Str ( ) [inline]
```

default constructor, create an empty str

3.23.2.2 [Str\(\)](#) [2/3]

```
Str::Str (
    const char * cp ) [inline]
```

Last two custom constructors.

create a [Str](#) containing n copies of c

The last two constructors are similar to each other. Their constructor initializers are empty, which means that data is implicitly initialized as an empty [Vec](#). Each constructor asks copy to append the supplied characters to the initially empty data.

3.23.2.3 Str() [3/3]

```
template<class In >
Str::Str (
    In b,
    In e ) [inline]
```

create a [Str](#) from the range denoted by iterators b and e

The most interesting constructor is the ifnal one, which takes two iterators and creates a new [Str](#) that contains a copy of the characters in the given sequence.

What is interesting about this constructor is that it is itself a template function. Because it is a template, it effectively defines a family of constructors that can be instantiated for different types of iterators.

This constructor could be used to create a [Str](#) from an array of characters.

The documentation for this class was generated from the following file:

- /home/oohnohnoh1/Desktop/GIT/Research/Parallel/include/openmp2.hpp

3.24 Student_info Class Reference

Public Member Functions

- **Student_info** (std::istream &is)
- **Student_info** (const [Student_info](#) &)
- [Student_info](#) & **operator=** (const [Student_info](#) &)
- std::istream & **read** (std::istream &)
